

KeychainAccess

KeychainAccess is a Swift wrapper for Keychain and requires iOS and OS X to work upon. This extension will help you to easily integrate Keychain APIs rather than the default implementation with the help of a wide range of methods. The KeychainAccess extension provides support for access group, accessibility, iCloud sharing, TouchID in addition to shared web credentials. The library is also compatible with watchOS and tvOS.

Pluralize.swift

Pluralize.swift is an excellent String Pluralize Extension for Swift. The main attraction of this extension is that it is case insensitive with several rules for irregular nouns. Moreover, it also provides support for uncountable nouns including the ability to integrate dynamic addition of rules. For instance, if you use “Dwarf”.pluralize(), then the extension returns “Dwarves”.

SwiftString

SwiftString is a lightweight string extension for Swift which enables you to work with Strings in wide range of formats easily. Some of the available methods supplied by the SwiftString extension are between(left, right), camelize(), capitalize(), chompLeft(string), chompRight(string), collapseWhitespace(), contains(substring), count(string), decodeHTML(), endsWith(suffix), ensureLeft(prefix), ensureRight(suffix), indexOf(substring), initials(), initialsFirstAndLast(), isAlpha(), isAlphaNumeric(), isEmpty(), latinize(), join(sequence) among others.

For instance, you can easily capitalize using the following syntax

- “Fast Track”.capitalize() // “Fast Track”

TextAttributes

TextAttributes enables you to easily compose attributed strings. The extension provides support for strongly typed properties, chainable setter methods including an enhanced auto completion feature. Moreover, you will be able to obtain direct access to the NSParagraphStyle properties. You need to enclose the required parameters inside TextAttributes() method and use the variable with the methods provided by the extension library.
