

gramming library used as an replacement to the Swift Standard Library. This extension is based on pure Swift and also provides support for Linux. The problems associated with the usage of Apple's Foundation are minimized with this extension since it provides a POSIX-based implementation for ultimate portability. From the developer's eye, the SwiftFoundation is a pure Swift replacement for the Cocoa frameworks.

SwiftyUtils

SwiftyUtils provides all the required modules which are required for successful deployment of Swift projects by supplying extension, protocols, structs and subclasses. It is compatible with iOS, OS X, and tvOS. The SwiftyUtils offers extension for Int, Double, String, Dictionary, CollectionType, MutableCollectionType, NSObject, NSDate, NSTimer, NSURL, UIColor, NSColor, NSUserDefaults, Arrays among others. Moreover, it also supplies protocols such as Injectable, Occupiable and Then.

For instance, you can capitalize the first letter by using the source code given below

- `var digit = "fast track"`
- `digit = digit.capitalizeFirst`
- `print(digit)`

The above code returns the following output

- `Fast track`

URLPreview

URLPreview is an NSURL extension which will display preview of webpages just like what you see in social media platforms. However, this library solely depends on Kanna, which parses HTML/XML on Swift. The integration of this extension is very easy with only few lines of code.
