Conclusion

In this chapter, you have learned about the useful plugins and extensions which are used to simplify the work during Swift programming. There are plenty of other extensions available. However, it is not possible to list all of them here. You should regularly monitor github.com to find out if there are new extensions available. We also presented to you useful resources in the form of articles, books, courses, videos and podcasts, which will be useful in your quest to become a Swift programmer. If you would like to build iOS apps, you should learn Swift. You can consider the information we have presented on this chapter and in this Fast Track as the starting point. We wish you all the best.
