

Make sure you check “Git repository on”, before you choose where to save your project.

When you click “create”, XCode will automatically perform a commit, for you. You could modify your ViewController to print a message. You can commit your changes by clicking “source control” in the top menu, and then clicking “commit”.

It will bring up an interface which will allow you to add a commit message. Once you’ve added your commit message, click on “commit 1 file”, in the bottom right, and you’re good to go.

Now, it’s time to go to GitHub. Once you’re on GitHub, click on the drop-

down menu beside your account name, and click on “create new repository”.

Name it whatever you like, and click on “create repository”. It will then show you a link. Copy that, and go back to XCode.

Once you’re back in XCode, click “source control” in the top menu. Select a branch name, and click “configure”. Now, click “remotes.” Once you click, you’ll be greeted by a window asking you to configure your GitHubTest.

Click the little plus sign in the bottom left, and select “Add remote...”

Give it the name you gave it on GitHub, and paste the URL of your new repository. Click “Add remote”, and then click “Done.” After that, click
