

Certificates” section, you’ll find a section that says “If you do not have the WWDR intermediate certificate installed, click here to download now.” Well you know what to do, click it.

Doing so will download a file called AppleWWDRCA.cer. You will need to install this. This will automatically open Keychain Access if you happened to have closed it. Once it’s done installing, you may as well keep Keychain Access as you need it again shortly.

Back on the browser, you’ll need a distribution certificate as well. So go to the “Distribution” option on the left-side menu and submit the same certificate signing request as with the development certificate. Using the same certificate for the distribution certificate shouldn’t be a big deal, but you can request another one if it so pleases you.

This will again take a while to become available for download. You will need both certificates in order to continue, so you can take a coffee break or something.

When both certificates are ready, “Download” both of them. Install both files in your Keychain Access, and you should be able to see both your certificates. You can now close your Keychain Access.

Now for the next step, register your device or devices. Go to the “Devices” tab and then on the right, click on the “Add Devices” option. In order to do so you’ll need to get the UDID of the device.
