

There are many ways to get the UDID. For instance, you can use iTunes to get your UDID. Simply plug your device into the computer, select the device from the menu. iTunes will display your device name, version, serial number, capacity and phone number. Clicking on the serial number will change it into your device's UDID.

Now that you have your device's UDID, go back to the browser and paste it into the appropriate field. You can name the device whatever you want. If you want to register additional devices, you can do so using the "+" button. Once done, click on "Submit". You can come back later and register more devices if needed. Apple allows you to register up to 100 devices per year.

Next, you need to register an app ID. Every app you build will need its own app ID. You now have to go the "App IDs" section from the left-side menu.

Things you need to know about app IDs

- You can choose to have your apps share the same speed prefix. This will enable them to be able to share keychain information between them. This is useful if plan to have a suite of apps which make use of the same
