

Once your app is tested and ready to roll out, you just need to submit it to Apple for approval. This part is easy after what you've been through so far.

On Xcode, choose the iOS Device in the scheme chooser, then choose "Archive" from under the "Product" menu. If everything checks out, Xcode will open the Organizer window with your app in the Archives tab. Now you need to click on "Submit". You needn't validate here as that'll be done when you submit anyways.

Now enter your iOS Developer credentials and click "Next".

Choose the app you want to submit. The submission identity required here is the provisioning profile you used to sign the app and should be there already. Once you click on "Next", your app will start uploading to iTunes Connect.

Once you're done with this step, you should receive emails from iTunes Connect confirming that your app has been uploaded and is waiting for review. Back on iTunes Connect you'll notice that your app status has changed to "Upload Received", shortly after which it will change to "Waiting for Review."

That's it! All you need to do now is wait for your app to be approved. You will be notified via email whenever there is a change in status for your app. Eventually it should progress to "In Review" and then to "Approved". After it's approved, the status will shift to "Processing for App Store" and shortly to "Ready for Sale".

If for some reason your App was not approved, Apple will email you with more information. They will be specific about what the problem is and what you can do to fix it. All you need to do is fix it and re-submit.

But that's it! You've successfully submitted your first app!
