Consider the following a compendium of beginners' essential web terminology, literally anything that has anything to do with websites, in alphabetical order.

Accessibility - This term refers to how easy it is to use a website, across different situations, say, on the various screen sizes of different devices, and for visually or otherwise technologically challenged users. This is an important component of a website emerging from the design choices.

ASCII - American Standard Code for Information Interchange. It is a code that assigns values to symbols and actions (of the keyboard) so that it can be mapped to what is displayed on the screen.

The ASCII table

Attribute - Attributes are additional properties that can be specified inside the html tags of an element. They specify information about the element that can be crucial to its functioning, which are given by values following an '=' sign. For example, the href attribute specifies the target address when using the <a> tag, as in Digit Home .

Backend - The backend refers to everything that is server-side, i.e- the database and server-side code that integrates the data from the database into the web pages. For example, everybody's Facebook profile page will
