

is best to understand what tool you're using, so as to avoid getting entangled in a massive mess of callbacks and slow page load speed.

A DOM example

Javascript libraries and frameworks:

Though most people start off with understanding JQuery and similar libraries/frameworks and then try to master Javascript, it's always recommended to get a tight grasp on JS concepts before moving on to these frameworks. To start off, you'll have to get the basic difference between these two. Current Javascript libraries like JQuery, MooTools and YUI, are basically entire toolkits which abstract different layers, like browsers / DOM models / etc. On the other hand, frameworks such as AngularJS, BackboneJS, describe a given structure of "how" you should present your code, generally keeping in line with patterns such as MVC, MVP and MVVM.

PHP:

PHP is a general-purpose scripting language which is most commonly used in server-side web development, in which case PHP generally runs on a web server. Its role is to facilitate the transfer of data from an input, which is generally a file or stream or PHP instructions, to an output, which is mostly HTML, though it could be JSON, XML or binary data. Any PHP
