

WordPress template hierarchy looks something like this

Moving it all to production

Once you are done creating a masterpiece of a web site you might want to show the entire world your creation. And this is where migration comes into the picture. While you might not have added a lot of posts, your database will be quite lean. However, we’re going the extra mile and letting you know what all needs to be done to migrate from your local development machine to an actual web host.

Create a database dump

Start up by firing up phpMyAdmin in your XAMPP control panel. Locate the main database that was created for your installation. The default prefix

Table	Action	Rows	Type	Collation
wp_commentmeta	Browse Structure Search 4 Insert Empty Drop	9	InnoDB	utf8_general_ci
wp_comments	Browse Structure Search 4 Insert Empty Drop	1	InnoDB	utf8_general_ci
wp_links	Browse Structure Search 4 Insert Empty Drop	9	InnoDB	utf8_general_ci
wp_options	Browse Structure Search 4 Insert Empty Drop	129	InnoDB	utf8_general_ci
wp_postmeta	Browse Structure Search 4 Insert Empty Drop	1	InnoDB	utf8_general_ci
wp_posts	Browse Structure Search 4 Insert Empty Drop	9	InnoDB	utf8_general_ci
wp_terms	Browse Structure Search 4 Insert Empty Drop	1	InnoDB	utf8_general_ci
wp_term_relationships	Browse Structure Search 4 Insert Empty Drop	1	InnoDB	utf8_general_ci
wp_term_taxonomy	Browse Structure Search 4 Insert Empty Drop	1	InnoDB	utf8_general_ci
wp_usermeta	Browse Structure Search 4 Insert Empty Drop	11	InnoDB	utf8_general_ci
wp_users	Browse Structure Search 4 Insert Empty Drop	1	InnoDB	utf8_general_ci
11 tables	Sum	133	InnoDB	latin1_swedish_ci

Export your entire Database
