

passwords for different accounts. LeakedSource published a table about the most commonly used passwords on LinkedIn and it's the stuff made of cyber-security nightmares. The most commonly used password is "123456", second most common password was "linkedin" and then came "password", at the third spot. It must be noted that the hack occurred in the first place because LinkedIn stored the passwords in SHA1 with no salting, which makes them extremely easy to crack.

Rank	Password	Frequency
1	123456	753,305
2	linkedin	172,523
3	password	144,458
4	123456789	94,314
5	12345678	63,769
6	111111	57,210
7	1234567	49,652
8	sunshine	39,118
9	qwerty	37,538
10	654321	33,854

The LinkedIn hack's most common passwords

Apple iCloud

There's also the iCloud break-in of September 2014. Hackers stole a collection of almost 500 private pictures of various celebrities, mostly women, such as Jennifer Lawrence and Kate Upton from their iCloud accounts. The images were believed to have been obtained via a breach of iCloud but it later turned out that the hackers could have taken advantage of a security issue in the iCloud API which allowed them to make unlimited attempts at guessing the victims' passwords. In this case, the blame rests with Apple and its security mechanisms. But it also serves as a vital lesson for us to avoid storing compromising and/or personal data on any public server.

Sony

And who could possibly forget the infamous hacks on Sony servers, once in 2011 and another in 2014. While the 2011 attack led to seven million PlayStation Network and Sony Online Entertainment account details being stolen, including but not limited to credit and debit card information, but the 2014 hack reared its ugly head of economic loss. Data included personal information about Sony Pictures employees and their families, e-mails between employees, information about executive salaries at the company, copies of then-unreleased Sony films, and other information. Millions of dollars were lost because of the leaked movies, and the studio was left worse for wear due to the loss in reputation. It might be worth noting that the 2014 attack was instigated by the release of Sony's "The Interview", which the hackers were against, because of
