

Your phone is like a security locker for all your information that you wouldn't want robbers getting into

password instead too. But we recommend you to use this security provision to the fullest. There are also options like facial recognition and even fingerprint scan in some devices. Use them, you cannot be secure enough. After all this is your phone we are talking about. You wouldn't want your personal information accessed right? Hackers are very creative when it comes to such thievery.

Applications

Google play store blew the world away. Suddenly, games like angry birds and apps like Face book and Instagram were at your disposal. Google has always been a harbinger of the 'free for all open source' movement. It encourages developers to experiment and test their products out at a global level with much ease. However, this coin too has a flipside. Google Play store is the biggest online marketplace offering all kinds of services. However, it is not the only online marketplace for android. Although the usual android phone is factory set to NOT allow downloads from unknown sources, it is common practice as this setting can be easily changed. That being said, even Google Play store may not be safe enough as it might sometimes have malicious
