

There are a lot of people looking forward to break into your phone by using otherwise harmless looking applications

make your phone download more other apps without your consent. You don't want that.

Network

The internet is filled with opportunistic people who want to scam their way into your phone and get your personal information. It is simply not possible to not be on the internet too. It's a coin with a flipside. However, if you take some easy subtle safety measures, you can secure the network you are on and thus, your android device.

1. Be on a secure network at all times

If you have a Wi-Fi service, make sure it is password protected. People can access your device if you are on an unprotected network. Also, avoid using unknown public Wi-Fi's. Free Wi-Fi, as tempting as it might seem, comes with a lot of danger. The hacker can use simple applications and snippets of code to break into everyone on the same network as you if it's not a protected network. There is a way to make sure this doesn't happen. Use applications like HideNinja VPN to make sure your outgoing network is always encrypted with a digital signature, hence killing the chances of a compromise in security.
