

2. Don't use just one account

If you share a device with someone, e.g. a tablet or a phone, you have the option to create multiple accounts to make sure that your stuff stays exclusive to you. This can easily be done by going to **SETTINGS** and the **USER** section in your android device. This way you can easily share the device with other people and have separate password and preferences for the separate accounts. You can find apps on the play store to help you manage different accounts on your android device too. For example, **SWITCHME** or **PARALLELSPACE**. There are even apps to create multiple social accounts on the same device for apps like WhatsApp and Facebook. If you are sharing your device with someone, you can make sure that your data stays truly private.

3. Security apps

There might be many malicious apps out there but genuine apps that can save you from such applications exist too. The best example is probably **AVG**. It is a free bundle; there is a paid version too with some better features. It comes with basic security options like not letting you download stuff from unknown sources, tracking your phone in case it goes missing, etc. Also it keeps on doing thorough checks to see if any malware exists in the phone. There are several applications like this you can use. But be sure to use a trusted application for this purpose only. You don't want to get infected by an application that meant to protect you in the first place. So here are some trusted applications that you can use

Just be sure to download security apps
from secure sources

1. AVG
2. AVIRA anti virus
3. Norton anti Virus
4. AVAST mobile security
5. CM Security

When you lose your Android device

Everything is good until you lose your phone or it gets stolen. Our lives depend on our phones, our contacts, passwords, applications. And if your
