

phone is to get stolen, the whole world comes crashing down. What's worse is the situation of your stolen device landing in unwanted hands. This is a big issue for all android and phone users in general. However, there are certain applications now that can help you retrieve your stolen phone using GPS SAT-NAV or even wipe off all your data remotely. Here are some measures you can take in case you lose your android device

1. Wipe your data

In case your phone gets stolen and you are certain you are not getting it back, you must erase your data immediately using a remote data wipe mechanism.

You can follow the following procedure as it is mentioned on the Google official forum:

- "Select Remote Wipe when a device is lost or stolen to erase all data on the device and to do a factory reset. You can remote wipe an Android device with the Google Apps Device Policy app installed and any supported mobile device with Google Sync configured. All data is erased from the device (and SD card, if applicable), including email, calendar, contacts, photos, music, and a user's personal files.
- Note that Remote Wipe erases the device's internal storage. Your user's device must already have Device Policy (or Google Sync) configured. You cannot install Device Policy and run Remote Wipe retroactively. For Android 2.3+ devices, Remote Wipe also erases the device's primary SD card"

Plus you don't have to feel bad about having to erase all this priceless data, because you followed our advice and had taken online backup Data. A little bit of planning goes a long way.

2. Remote Track your Lost phone

If you lose your phone and want to track it using some other android device, you can either use applications like AVG security system or you can download additional apps like 'FIND MY PHONE' for android to GPS track its location using satellite navigation.

You can even do this without any extra application as well. You just need to have a Google account. Your android device must just be connected to internet. Your android device is equipped with a location tool called ADM (android device manager)
