

monitoring policy and not just anyone with a malware app can upload it for the whole world to download on iStore (unlike on Google Play Store). And although this policy is debatable and is almost always argued upon, it works to some extent. However, as safe as this may sound, it is no surprise that Apple iPhone's security has been compromised from time to time and you should take precautionary measures nonetheless.

We shall tell you about General settings that you should change to ensure that you secure your iPhone.

Then we shall tell you about some applications that might come in handy to make sure your iPhone stays hack-free.

## **General settings**

### **1. Keep your iPhone firmware updated**

Apple comes up with frequent updates for the iOS. Be sure to follow them carefully as with every new update, they tackle security issues present in the last one and deem that version almost redundant. Go to Settings>General>About. There you shall be shown the current version of the iOS firmware. Be sure that this is the latest firmware because if it is not, your version of the firmware is vulnerable to intrusive security breaching attacks.

### **2. Keyboard Cache**

This one is a little tricky. Your keystrokes are stored as a database in the iPhone directories as cached memory for up to a year. This database basically includes all your typed words and the automated response of the phone via the phone's keypad for them. A clever hacker can break into this database with ease and data mine this into finding out important details like your information or even your passwords. You should keep this cache cleared. This is not at all a paranoid practice. There have been reported instances of this feature being exploited.

Navigate to General in Settings>Reset>Keyboard Dictionary. This should reset your keyboard cache for you.

### **3. Disable features which can be accessed without pass code**

Your iPhone has several features on the home screen, even when the phone is locked, that can be accessed. And you have a say in them being accessible. For example, turn the Voice Dial feature off by going to Settings and disabling it.

Also, your messages can be previewed on your locked home screen as a prompt pop up. This is probably the simplest, most overlooked factor
