

in iPhone security. You must keep this feature disabled if you don't want people reading your private conversations.

4. Secure passcode and auto timeout

You must have a secure password for your device. Not just the four digit numeric password. That can easily be guessed by people or even judged from the smudges on your phone (Mr. Robot much?). Try going for the fingerprint as well as the alphanumeric password option to keep a long secure password. Also, you can decide after how much time your phone locks itself. Be sure to enable this feature so that even if you forget to turn it on standby mode manually, your phone does it on it's on. It can be easily decided and enabled in the Settings menu of your phone under the Auto-Lock option.

Be sure to use the fingerprint scanner feature of the iPhone

5. Erase Data setting

Now this may seem a little harsh, but if you have secure online backup of your phone, and your phone security is very important for you, you can set the number of times that a wrong password is entered after which the data of your phone is erased.
