

You must never be on an untrusted network and use a VPN hider if you have no alternative

You can also make sure that your SSL setting is enabled while using email and Gmail. Go to Settings>Mail and calendars>Advanced>Toggle the SSL option ON. SSL stands for secure socket layer and this will make sure that your emails are transmitted securely.

9. Find My iPhone

Apple has a special service called 'Find My iPhone' which is free of cost and helps you retrieve your stolen iPhone. You just need to add a 'MobileMe' account and then login to the account using your AppleID. Once connected, the Find app will be turned on and the location of your iPhone can be remotely detected. In addition to this, you can also get it to do a bunch of stuff like display messages, or make beeping sounds. The service works ONLY if the device is password protected. You can even use this service to 'RemoteWipe' all your data in case you are certain that your iPhone is beyond retrieval. And then you can retain all the lost data from the cloud backup.

10. Restrictions

You can set certain restrictions on all your apps by enabling certain options in Settings. They are basically parental codes and would require a security passcode to be entered every time the user tries to access the applications. This is very important and useful feature as by using this feature, you can assure that your social apps stay exclusive to your use only, even if the first security level of the home lock screen is bypassed. You must use this
