

Learn how to secure your Windows account

companies in the world. It is always on its toes and is super fast in releasing critical patches and updates to make your computer more secure. This is not to say that Microsoft Windows has always been this way and is known to have a sad security history, but the company learned from its mistake and has been successful in making Windows 10 one of the most secure Windows versions ever, while also being the most targeted OS out there.

If you think of it, the reason for this is simple. Imagine if you had a year to learn how to break into Vault A, used by 80% of the banks, or Vault B, used by 20% of the banks, What would you choose?

Windows dominates the PC and laptop OS market with a 52.02% share while Apple and Linux Kernel based OS have a 26.2 % and 21.7% share respectively. Chances of encountering a Windows machine on the internet are more than any other. And this is why hackers everywhere are religiously creating new viruses and malwares, and exploiting zero day vulnerabilities to get into your Windows machine. And it's not just the 'bad guys' who are after you. The technology buzzword of last year was privacy and the 'good guys' (read: Microsoft) are after your data too.

Worry not though. We are here to teach you how to secure your Windows machine, from both the good and bad guys.
