

need. Then go to Tools>Startup and disable all the unnecessary software and bloatware that you come across.

- **Update your Windows and all other software, especially your browser**

According to data collected by Kaspersky lab, one of the biggest antivirus vendors, almost a

million new threats are unleashed online every day which include viruses, malwares and zero day vulnerabilities. The best bet to protect yourself against these threats is to keep your operating system and software completely up to date. Set all your important software, especially your browsers, to automatically update. Also set your Windows to automatically download and install all new updates. Type 'Update' in the Start menu search box and select Windows update. Change settings to Install Updates Automatically (recommended) if it is not already selected.

These steps should be enough to clear your computer of any threat, but if you want to be 100% sure about it, then do a fresh installation of it on your machine. To do so, follow these steps:

- **Do a fresh installation of Windows**

Doing a fresh installation is the best way to go about securing your Windows PC. Even out of the box machines that come with pre-installed windows have extra junk and bloatware installed that slow down your computer.

- **Update your browser and other important piece of software**

It's not Windows who is always guilty. There are a number of popular software which are commonly used and known to have a history of security vulnerabilities. Software like Java, Adobe Flash, Adobe Acrobat Reader, Google Chrome, Mozilla Firefox are regular targets of hackers looking for weaknesses to exploit and break into your machine. So make sure all your software are updated regularly.

CCleaner can do a number of things including clearing out your junk, uninstall programs and remove software from startup
