Saving yourself from the 'Good guys'

It's been a long time since it became common knowledge that privacy is a myth. The government is tracking everything you do. Facebook doesn't delete your personal information even after you delete your account. Microsoft collects tons of personal data about you. All the 'Good guys' are wolves in sheep's clothing and we are here to protect you from them.

You would think that saying this is a stretch but once you look at all the information Microsoft's latest OS, Windows 10, collects you will realize that maybe this is something you should be worried about. Everything from your address book, GPS locations, credit card numbers to your audio and video messages are collected by Microsoft. And guess who gave them the permission to do so?

YOU. The terms of service agreement you skipped reading (we know, we all did) said that you allow Microsoft to do all this and much more.

Well wouldn't it be scary if one day Cortana wakes you up with the nickname only your mom calls you by? Read on to find out what you can do to stop Microsoft from invading your privacy and secure your computer.

• Turn off tracking in the privacy menu

The fine print in Microsoft's privacy statement says that company uses your data in 3 ways. "To operate their business and provide, improve and personalize the services they offer", "To send communication, including Promotional communication", "To display advertising". And to do this Microsoft collects tons of your personal data. To view and change these settings, open your Start menu and type "privacy". After opening your privacy settings you can see a list of permissions for various things including your location, access to camera and microphone and much more. Once selected, you can either completely turn off the data collection or do it for individual applications for each of these. Also, go to 'General' and change the 'Send your device data to Microsoft' setting to Basic.

• Don't Create/ Disconnect your Microsoft Account

Windows 10 asks you to create a Microsoft account by default. You can use this to log into your computer. It also comes with a built in 2 factor
