

about breach of temporary files, swap files and other directories where significant files may lie.

And unless the computer is pre-historic, the slowdown due to encrypting everything on it is barely perceptible. In many Linux distros including Ubuntu and Fedora, full disk encryption can be done during installation itself. You just have to select the “Encrypt the new Ubuntu installation for security” option.

Keep the software updated

Keeping software up-to-date is so not an exercise in vanity like keeping abreast of the latest trends in fashion without really knowing if they actually suit you or not. Regardless of the OS, you should always keep the OS

Update, secure.

and other applications-including but not limited to web browsers, PDF readers and video players- updated.

And it's easy to perform on most Linux distros. On Ubuntu, for instance, the security updates are automatically installed. To make this happen, just make sure that the “Important security updates” option is turned on by going to System Settings->Software & Updates->Updates

Make use of Linux Firewall

The Linux kernel comes embedded with a Firewall component called ipfire.
