

Let's call it the power of one!

when required using sudo. Without sharing root password with other users and admins, sudo enhances the security of the system. It also gives some simple auditing and tracking features as well.

Ensure security of the physical server if you have one

It must be ensured that the Linux server's physical console access is protected. To this end, configure the BIOS and also disable booting from

Don't forget what's in the brick-and-mortar world!

```
Terminal - ssh - 80x20
root@host [-]# adduser lwsupport
root@host [-]# passwd lwsupport
Changing password for user lwsupport.
New UNIX password:
Retype new UNIX password:
passwd: all authentication tokens updated successfully.
root@host [-]#
```

That's cutting off the root of a problem!

external devices like DVDs and USB drives. To protect these settings, set BIOS and grub boot loader password. Make sure that all production boxes are locked in Internet Data Centers. Also that everyone should pass through some security measure before they can access the server.

Delete X Windows

X Windows on a server is not exactly necessary. No reason exists for you to run X Windows on your dedicated mail and Apache web server.

X Windows can be disabled and removed to improve server security and performance. Edit/etc/inittab following which set the run level to 3. To remove X Windows system, use the following command:

- # yum groupremove "X Window System"
