

that ensure minimal susceptibility to malware. There must exist at least one admin account and if you're the sole user, as is mostly the case, that will be you. It is a good idea to create an unprivileged non-admin account in addition to this, to use for your everyday activities. Doing this will greatly reduce the amount of risk that you are exposed to, and even if something malicious gets in, it won't be able to accomplish much. Other than a compromise of privacy, the main purpose of security is that you don't lose your files, so backups are also a basic step for prevention of data loss. Take them regularly, and take them often.

Use your secondary account for your daily technology chores like reading manga or downloading songs. You can store your files without hassle and if ever you need to install something, you'll be asked for the admin login details. On the one hand this does mean many more popup dialogues to enter credentials if you have relationship issues with software, but on the other, it gives you the freedom of being more exploratory while wandering the web. Also, set up your login screen to prompt for the password often if you leave your Macbook lying around.

Prevent a passerby peeping

Getting a Complete Firewall

Apple includes a firewall built in to the Macintosh, however that is an incomplete firewall because it blocks incoming connections but has no check for outgoing connections, which is what malware writers use for stealing data. A good two way firewall is one of the first pieces of software that one should
