

Also if you head to the Privacy tab on the same System Preferences page and selection Location Services on the left, the right hand pane will show you all the apps that are allowed to access your inbuilt location services and also the apps that have utilised this service in the last 24 hours. Keep a lookout for software that should have no business knowing where you are, it may be broadcasting your location to a malicious data merchant.

Regularly Updating your Software

Another very basic precaution that can prevent being the target of malware attack is regularly updating software as most known Mac vulnerabilities and holes target flaws on older versions of Mac's OSX and other software. Security patches and fixes are rolled out officially in updates from the authoring company and so it is highly recommended to keep your operating system and all third party software up to date. This may sound obvious but

Keeping your Mac up to date

many people skip updates out of data usage concerns or sometimes even pure laziness. While not always a must-have, software updates are almost always a good idea. Apple Store's Software Update is the place where you can handle it all.

Staying away from Warez

Warez is a popular term for illegal peer to peer file sharing software that allows users to download and share pirated songs, movies, etc for free over
