

exchanged with others. Even though a virus for Windows will not affect a Mac, it can certainly pass through, and ClamXav (or your favourite Mac antivirus) can detect and delete it for you.

Conclusion

It is well and good to take precautions but at the end of the day, the fundamental piece of the security puzzle is the user. A lot of trouble can be avoided with common sense and safe browsing practices. Congratulations! By choosing to use a Mac you have already dodged 99% of the malware out there. Thanks to statistics, along with the above mentioned steps, you may yet remain protected as you surf the wide web. A cliché worth repeating, better safe than sorry. **d**

Good or bad, technology aids every business
