

Make use of a password manager

Coming up with a super-secure password is not our niche. This makes using a password manager a rather good idea since they have the feature with which you can generate secure passwords.

Lastpass is one such service. Once you have signed up for it, you can alter the password manually and then make use of the password manager's secure password generator. A secure password does make your social accounts way more secure. But that doesn't mean they become impenetrable. However, the safety quotient certainly goes up with harder-to-guess passwords.

Manager for a secure environment

As much as possible, use a separate email address for social accounts

While it's the case that many people are lousy at coming up with strong passwords it's also true that people often reuse the same password on multiple accounts. This can be a huge issue since if a hacker can access your social profile, they won't just stick to your social profiles.

To be more clear, they are gonna try the password on multiple platforms. Possibly the most sensitive digital data regarding yourself is to be found in your email account and you can be sure that the hacker's gonna try the password there as well. If you are part of what we suspect to be the majority, you would have used the same password everywhere.

The better alternative is to have a distinct email account for your social profiles. Make sure that the email you are using isn't the one that has financial or other personal data attached to it. That way, even if someone gets into one of your social profiles and figure out the email id, your main account remains out of reach. A simple but effective method by all means.

Keep it separate, keep things safe

As a recovery option, add your phone number

There are many social platforms, and most of them allow you - the user - to add a phone number as an emergency recovery option. The merit of such
