

That's why being wary of opening links shared on the platforms – particularly if they're shortened links is not a paranoid reaction but an intelligent strategy to stay secure.

Another thing you need to be cautious about is any link that's embedded in an email message which supposedly arose from a social network provider, or some other trusted source. If at all you find yourself on a page which doesn't feel right, close the browser tab making

If it doesn't look right, it probably won't click right!

sure that you don't click on any buttons on the page itself – so that you don't end up the victim of clickjacking attacks etc.

You can instead try connecting directly to the site instead by typing the URL on the address bar.

Check your email for suspicious login attempts

Good social platforms improve their information security practices more or less continually, Facebook and Twitter are particularly effective with their improvement strategies. Whenever there's suspicious activity with regards to your account, you will be alerted. So, do check your email for such mails, and take appropriate action if necessary.

One of the rare times when a mail not from a friend/family may be worth it!

Most of the social media accounts not only block suspicious login attempts, they will promptly ask you to change the password as well. If such is the case, you should by all means change the password asap to minimize the chance of a malicious agent laying his digital hand on your personal info.

Be conscious of the type of info you're putting out there

This may sound kind of obvious – saying that you shouldn't put up sensitive
