

information for anyone to see. But the thing is, we all get carried away at times and end up putting up info – about others or ourselves which would be better off remaining private.

And sometimes the info you share without realising might have been private for someone else. For instance, if you're mentioning the names of your friend's kids online, you should be sure that they are okay with that – younger people are always the most vulnerable on an online platform.

Draw the line on what you put on the page

As for your own privacy settings, you should do a double-check since your page may be visible to all viewers, regardless of whether they are a friend or not. Such public info, if it falls in the wrong hands may be used for nefarious activities like identity fraud.

Make use of good security controls

There exist good network security products that enable you to provide application control on FB and Twitter. A dedicated SSL application for decrypting SSL traffic or a next-generation firewall are examples. Some of these products would also scale based on the network performance requirements.

Bring in an ally, in this case a good security control

Avoid unnecessary add-ons and apps

Quite frequently, you see games and apps that are promoted through social media. Well it does make sense, since almost everyone spends more time on here than in the real world these days. But the problem is not just that there might be an overwhelming number of
