

3. Go to 7-Zip > Add to Archive
4. Set the Encryption method to AES-256 and enter a strong password that is long and a good mix of alphabets, numbers and special characters
5. Click on OK and Voila your encrypted archive is created.

Now share the file over cloud storage and share the password over some other medium like email or IM.

Email

Email is one of the most used means of communication over the internet, specially for important and sensitive information. Unfortunately, it is also one of the most vulnerable ones. Email accounts are regularly hacked and emails are routinely intercepted. Your email provider keeps a record of all

SecureMail for Gmail is an extension that lets you encrypt and decrypt emails right from your browser window

your emails, which they have to handover to government agencies in many cases. So what can you do to secure your email account? Read on to find out.

The emails you send don't only contain the text and attached files. They also have a lot of metadata like your IP address. Email service providers such as Yahoo and hotmail don't hide this information which make you more vulnerable. Gmail on the other hand hides your IP address and unlike the former two, also encrypts the content of the mail. But it still keeps a record of them. However, you can use the 'Secure mail for Gmail' chrome extension to encrypt and decrypt emails from right within your browser window.
