

able everywhere or simply share our favourite moments with others. Cloud-first has also become a primary part of a lot of businesses strategies. The productivity ease and versatile storage capabilities make it a lucrative technology to invest in. But even with such widespread acclaim, most of us fail to consider the underlying truth about internet. Nothing is safe. Or at least not safe forever.

In the light of this revelation, encryption becomes a guardian for everyone. But the trouble is, encryption and online security have many layers to it and therefore it's easy to get fooled into believing that your data is being kept 'secure'. This 'security' could mean any level of security. Most of the

popular services such as Dropbox lack substantial security measures to truly make your data private. Plus, the lack of HIPAA compliance which protects your medical information from being openly available is also not given much importance. But there is always a silver lining on the internet. Here are some services which actually provide security to your data.

pCloud is a Swiss service which inherently means extreme privacy. To increase the confidence of people, they even hosted a challenge to hack their system within 6 months. Interestingly no one was able to take the prize of \$100,000 home. Next thing you notice is the generous amount of free storage the service provides. 20GB! Sharing the files is just a right-click
