

remotely, save audit logs, have access to unlimited versions and HIPAA compliance make it a wonderful choice for businesses as well. Although only the latter two are available in the free account. Downsides? The desktop client poses limitations in sharing options and often requests opening of the web version. The single sign-on helps considerably in this matter though. Also mobile app and web version lack the ability to upload folders.

Pricing:

- Starter - Free - 5GB
- Business Pro - US \$49.00/Year - 500GB
- Business Pro - US \$89.00/Year - 2TB

E-box is a service which is best kept for businesses. Everything from complexity of the features to pricing modules says it all. E-box boasts of a web interface which is simple and able to run on all interfaces, plus there are no software installations required. The experience here is actually a mix. There is also a robust grouping system. This allows some really great permissions and file sharing customization. There is also an extremely detailed auditing system, which records every single action performed by every single user with timestamps. The security is almost impossible to crack, but giving the ability to manage keys personally would have been a more powerful option. Sharing files or folders require the other user to have an E-box account, there is no way to share public links. The interface doesn't provide any preview or a quick access menu. This coupled with a complicated UI, especially during initial setups can be a major setback. Although there is an interactive wizard to help you around a bit. E-box might lack a huge deal in terms of user interface, but it fills that void with its richly detailed features which allow an exponential amount of customization.

Pricing:

- Business - £5/Month/User - 1TB/User (multiple users)
- Private Cloud - From £1,000/month - Customized

SpiderOak One sacrifices usability for extreme security. This one's for people who don't care much about anything other than security and privacy. SpiderOak calls this Zero-Knowledge Guarantee where the user owns the encryption keys. Every file is locally encrypted on the user's computer before being sent to the server, making it nearly impossible for anyone to
