

the interface of your comfort. For such scenarios we have the following services which add local encryption to your files while you upload.

Boxcryptor encrypts files or folders and turns them into a .bc format which then can be easily either uploaded or synced using any cloud storage service. Boxcryptor works wonderfully with any service that uses WebDAV. While you setup the client, Boxcryptor needs to be specified a safe folder which is basically your existing cloud syncing folder. To view an encrypted .bc file, boxcryptor needs to be mounted on a drive. Paid versions allow filename encryptions as well. The company package provides the master key and allows enforcement of policies.

Pricing:

- Basic Features - Free
- Unlimited Personal - US \$48/Year
- Unlimited Business - US \$96/Year (multiple users)

Viivo is similar to Boxcryptor, it locally encrypts the files. A little advantage here is that during installation, Viivo recognizes installed storage services and sets them up respectively. Instead of mounting a drive, a folder is created. The Pro version also includes multifactor authentication.

Pricing:

- Personal - Free
- Business - US \$4.99/Month (multiple users)

Finally, cloud backup services. Cloud backup is a little different from cloud storage. Where in storage you pick out files and folders to be put on the cloud to access later, in backup essentially a copy of your whole computer (excluding the OS) gets backed up on the cloud. Yep, these are the big boys of the town.
