

need to focus on the audio completely and immerse themselves such as sound engineers, DJs, Video Editors and audiophiles of course. Over the ear headphones are better, because the larger ear pieces are used to house more electronics such as an active noise cancelling circuitry or a bigger battery in case of wireless headphones.

In the ear

These are the most common type of headphones and come bundled with almost every smartphone, music player and tablet. Headphones which are inserted into the ear are very convenient, and are often referred to as earphones. Earphones can be again classified into in-ear headphones or earbuds. In-ear headphones rest in your ear canals and push sound very close to your eardrum. These are much preferred as they are better sounding and provide a good fit, but some people with larger ears tend to prefer earbuds, which rest in the outer canal only. In ear headphones have closed drivers which create a good seal depending on the quality of the ear tips and block out a good deal of outside noise. Earphones also usually come with inline microphone and a remote to control volume, play/pause music and to take phone calls. These are referred to as headsets instead of headphones. In-ear headphones are also called canalphones because they are supposed to sit inside the ear canals. These deliver sound closer to the ear drums, but are sometimes risky to wear and might cause irritation if the rubber used in the ear tips are not of good quality. Canalphones provide comparably a lot more noise isolation than regular ear buds as the ear tips are able to form a good seal in the ear canals.

In ear headphones and canal phones have variants with respect to the ear tips used. Some options in the market include additional ear tips made of memory foam, which remember the shape of your ear canal and provide the perfect seal and fit in the ear. These can be bought separately as accessories and are sold in different configurations according to the purpose such as noise isolation, comfort and fit.

Ear Cup Type **Open Back**

Dwelling further, these headphones can be further made as closed back or open back. Now, the types might sound daunting, but we've broken it up to make it easier. Open back headphones have grills on the outside of the ear pieces which allow the speakers to 'breathe' or let some ambient noise
