

Sound has never been so sophisticated

The rapid rise of consumer electronics has resulted in an equal rise in their accessories and associated peripherals. Now almost everyone has a smartphone, (and sometimes also a dedicated music player,) and with that at the very least, a pair of earphones. Phones were originally just meant for voice communication but now accomplish so much more, and today we collectively consume more multimedia than food and water. OK, that may be an exaggeration but you know what we mean. A significant aspect of this entire entertainment consumption revolution, with an entire technological field of its own, is Audio.

Music is meditation and solace for a lot of people; an immediate escape from the trappings and tensions of this material world. Besides music, we also watch tons of video content, and the aural part of that can make all the difference, making it a truly immersive experience. One only needs to get a 4K or 8K display to treat their eyes, but if you want to treat your ears, it gets much more complex than that! From the hardware to the software and everything in between, there are numerous aspects of sound equipment that you have to understand to ensure an optimal aural experience and this is exactly what this FastTrack is about. Dedicated to Audio Technology, this little booklet aims to be your complete guide to exploring audiophilia!

The first chapter in this Fast Track introduces you to the field of Audio Technology, from where we specialize into the various domains of everyday sound. Starting with speakers, we explore the science of physically producing sound. The next chapter talks about the types of headphones in
