Music is never digital, it is only stored digitally. If you're wondering what literal digital music may sound like, think chiptunes, the original electronic music. Although, even that is analog by the time it's played by the speaker, strictly speaking. Just that the it's the analog waveform that looks a lot like a digital waveform. Confused? Time for examples!

For the sake of illustration, let us consider this Digital Discourse the analogue of analog sound/music. Naturally, it follows that the typeset text you see here is the analogue of what you hear, which we shall call Analog text. What it has in common with sound is that between its production and consumption, it passes through electronic technology, and therefore must get Digitized (pun intended). Therefore, the letters you are now reading printed on paper once existed merely as some sequence of Os and Is in the ASCII format.. Digital text. Now consider the following bit sequence:

01000100 01101001 01100111 01101001 01110100

Is this Analog text or Digital text? Even though it is digital in content, it is analog in form. In other words, it is an Analog representation of Digital text. Thus, we conclude, it is Analog text. Now, can you guess what it says?
