

AUDIO MYTHS

A lot of knowledge is what people say, and what people say is not necessarily the truth. This is where we separate fact from fiction.

In the audio technology world, the amateur and professional alike are subjected to a multitude of adages that have become common knowledge thanks to mindless repetition. This has more to do with the nature of our consciousness and our brains than actual objective fact. Many times the subjective experience overrules and adds distortion to the reality and subsequently, myths are born.

Myth #1 - Earphone burn-in periods

A very common myth among today's audio tech consumers is that a new pair of earphones need to be "burned in" for a certain period of time to deliver
