

And it will automatically switch on the heating system or the air conditioning. So, when you reach home, the temperature will be just right. The economic savings are also noteworthy.

Automated light

An automated light system can detect that you are entering the room and can switch on the lights for you. On the flip side, it can detect that the absence of a person in the room and switch OFF the lights and fan.

Home automation and smartphone

Smartphone is a great addition to the home automation ecosystem. An app on the smartphone will connect you to the home automation system in your house and you can control all appliances connected to the automation system.

Light control using phone

Even if you automate your home, there is a need to override the machine. You might not like to sleep in a room with lights ON, just because your presence in the room. At such times an app on the smartphone can come handy to switch off the lights. It can also help you remotely check if you have turned off the lights, switched off the AC or locked the door.

To conclude, we can thus say that a home automation system can help us a lot in daily lives. It has improved a lot with time and has also become affordable to a greater audience. There are some factors like security that need to be taken care of. But with continued improvement, soon we will see one in every house. **d**
