

Philips Hue Smart Bulbs

Then there's the LIFX LED Smart Bulb, that performs functions almost similar to the Philips Hue, but doesn't need a hub for control. Instead, you use your smartphone to control these. In addition, LIFX integrates seamlessly with the Amazon Echo, Nest and SmartThings. If you order the coloured version from overseas, you'll end up spending close to ₹3700 a bulb, while the dimmable white version of these would cost ₹2000 a bulb.

There's also the TP-Link Multicolour Smart Wi-Fi A19 LED Bulb, that is available for ₹3400, with similar functionalities as the other bulbs, and the Tunable White version of these that's available for ₹3000.

Smart with sensing

All the products mentioned up until now are “smart” in the sense that they can be controlled remotely. However, these light still don't have the ability to take care of lighting on the basis of presence of people in the room. To add such a functionality, we have to incorporate motion sensors into our smart lighting system. You'll have to keep in mind that to be able to allow your lighting to respond to motion sensors, you'll have to integrate a hub in your ecosystem, to allow your lights and sensors to communicate with each other. Keeping in line with what we'd said earlier, you'll need to make sure that the wireless protocol the sensor uses for communication is compatible with the hub, to avoid any installation problems later.
