

Philips Hue Lightstrip Plus

tures, it also has daylight sensing, that allows you to switch lights on and off as the sun sets and rises. An additional feature embedded in the sensor is the Nightlight setting, that lets you navigate the dark if you find yourself waking up in the middle of the night. Philips claims that the “warm, relaxing white light used in this mode is not too bright, making it easier for you to fall asleep when you get back into bed”.

All said and done, there are other ways in which your home lighting system can be enhanced to increase energy efficiency. Many people choose to have self-adjusting lighting and shades that can increase and decrease the ambient lighting in a home, depending on the time of the day. Such motorised and remotely controllable systems will need to be retrofitted by professionals, and can cost up to ₹20,000-30,000, depending on the number of shades you decide to have retrofitted.

Other parts of your home, where you might want to introduce a smart, mood-based lighting system would be a reading nook or your home theatre system. The most appropriate choice of lights would be remotely controlled lights, such as the Philip Hue ones we saw earlier. Or you could use a cheaper and more DIY approach, and use LED light strips in your home theatre rack, such as Philips Hue Lightstrip Plus, that can be stuck within and around your theatre rack. These light strips, available for close to ₹600, can then
