

Safe house

If you would have asked someone from the 20th century about their idea of what the houses in 21st century would look like, even their wildest interpretations wouldn't do justice to the technology that is available in the palm of our hands today. From home security systems to fully functional systems that tells you when breakfast is ready or when to turn off the oven, our homes have been largely benefitted by the growth in technology and this has made our lives infinitely better. Imagine the following scenario 20 years ago. A thief wearing a ski mask breaks into your house by using a simple crowbar and robs you blind while you are in your sleep. The thief leaves your home in an untouched state. You have no proof, or no recollection of what happened. Now if a thief tries to break into your fully automated safe house, he / she will have to pull off an ocean's eleven style robbery. Depending on the level of security of your home, they would have to dodge motion detectors, avoid security cameras and somehow get past the alarm systems that would inform the local police as soon as they are triggered. All of this, done automatically, by the coming together of software and hardware specifically designed to keep you safe. But it doesn't stop there. The technology available now to provide security to you is far more complex and dependable than just a few alarm systems and motion detectors.

Now you can connect all the appliances in your house to a single hub and control them through your phone
