

The Internet of Things

If you haven't heard of this term, you are probably living under a prehistoric rock. This has been a hot topic among developers and innovators since its genesis somewhere in the 2010's. IoT is defined as "the infrastructure of the information society" and it refers to the development of internet in which everyday objects have network connectivity, allowing them to send and receive data from each other. This idea is the basis of the need for an automated home. If somehow your car keys were connected to an alarm, you would know where they were every time you lost them. If your lights had data receivers, then you could probably control them from your Smartphone. The idea is to make everything connected and to make the connection elegant in such a way that it behaves in a system that eliminates manual work. This term has been thrown around quite a bit for quite some time now and we can see its implications everywhere; from smart cars to smart umbrellas. The sky is the limit for this new technology. Give such a concept to the DIY guys, and voila! You have intelligent arrangements that seem to be straight out of a sci-fi movie.

Now imagine if simple objects in your house like the windows on your walls, the doorbell, doors, air-conditioning, music system, etc., were connected to a single virtual administrator which gave them orders and made

Internet of Things makes your Smartphone connected to your kitchen,
connected to your garage
