

In the same way you can connect numerous devices to build your own security system. Let us take a closer look at how this could be possible.

Basic systems include door and window sensors, motion detectors, fire alarms, etc., and these are connected to the hub. The hub communicates with these devices using Wi-Fi, ZWAVE or ZigBee wireless protocols. You can go ahead and add several new features like garage door locks, smoke detectors, surveillance cameras, sirens, lights, etc., if you like the DIY approach better.

All these devices can either be controlled or given commands through some interface on your Smartphone, or the pre-installed home security systems will have a built in operating system in their hubs. Some systems available in retail even have separate remote controllers designed specifically for these arrangements.

The cheaper alternative

You can always buy a pre-built home security rig. But where is the fun in that, right?

There exists a vibrant DIY community in the domain of home automation. Essentially, all you need to get started is just the hub. You can get your own sensors and components and connect them to the hub. Here are a few examples of such components that you can buy online.

1. Smart locks
2. CCTV Cameras
3. Fire alarms
