

4. Motion detectors
5. Smart thermostats

The future of home security automation

New ways of automating your home are surfacing every day and we might be looking at a fully automated home in the near future. When it comes to security, the AVATAR III robot is a good example.

The robot is equipped with all the components that we have talked about earlier, i.e. motion detectors, fire alarm, security camera. The idea is that once such a house robot is installed, you can stop worrying about your home security entirely as such a robot takes all the decisions on your behalf. This type of technology is yet to become commonplace though.

Malls in Palo Alto, California already have robots as mall security (move over Paul Blart).

All of this IoT business has a flipside too. Since everything is connected to a hub, imagine the damage someone could do if they hacked into such a hub. Your

entire house would become accessible. This is the reason that you should go for paid services if possible and if they offer better security.

Another concept which we might get to see in the times to come is a fully functional A.I. security bot which communicates with you like SIRI does. Once it gets to know your preferences, you can leave the entire functioning and security of your home to the A.I. and let it take all the decisions for you.

A rather interesting addition to the world of home security are home drones. With drone laws still being debated it would be interesting to see how the laws shape up and in what ways and to what extent they could go to make our homes safer. **d**

You don't ever have to worry about the temperature again once you install the Honeywell thermostat
