

warm bubble bath. You take off your armour and sink into the water asking your smart home to play the 'chill' playlist and read out what is trending on the social media. Also, ask him (or her) to pour you a glass of whiskey from your automatic alcohol dispenser.

Of course not all of this is possible today. But that's the eventual home automation future many companies are betting on. And each of them are in the process of coming up with their own version of JARVIS (or a smart hub) that will enable all of this.

Today however, home automation is a relatively young technology. There are several companies, each with its own range devices and smartphone applications. All these devices, though smart, have one basic problem. If you want to automate and turn your house into a smart home, you'll have to install a plethora of devices and all the corresponding applications on your phone, and use each of them separately. So, if you want to lower the temperature of your room, you must locate the thermostat application in your already crowded app drawer, select the corresponding options and lower the temperature. Forgot to switch off the kitchen light? Look for your phone, locate the application that controls the 'smart' lights in your house and turn off the light.

Not so 'smart' is it?

This is where home automation hubs come in. These 'smart' devices act as a 'bridge' between you and your smart home devices. So instead of

J.A.R.V.I.S could not only set up alarms but also helped Tony save the world and find new elements.
