

Easy to setup, the device comes with an AC/DC power adapter, Ethernet cable to connect it to your home network and 4 AA batteries, which are supposed to keep it running for up to 10 hours in the case of a power outage. Plug it in your home network, download the app on your phone (available on IOS, Android and Windows), setup your account on the cloud and Voila! You are good to go.

If you are out looking for a smart hub, the Samsung SmartThings V2 should surely feature in your top picks

Out of the box, the device does what it is supposed to do, it will automatically scan and connect to all the smart devices installed in your house, and add them to your smartphone application, from where you can easily control and automate them. But this is not where it ends. To squeeze the maximum out of your SmartThings V2 hub and make it

smarter, there exists a web-based IDE (based on Groovy) that lets you code and customise your SmartThings Device. If you are not into coding, or are new to it, don't worry. There is a very active user community of the device online that have already developed many nifty and useful capabilities for it. Also, the device can be integrated with IFTTT (If This Then That) making it even more flexible and increasing its automation capabilities.

SmartThings also supports Apple Watch and Amazon Echo, the latter lets you control your house in a more JARVIS-isque style through Alexa, Amazon's voice based AI assistant.

The device isn't without its flaws though. It still requires you to have an active internet connection if you want to access it via the mobile app, which means, even if your phone and the hub device are connected to the same network, you can't control it if you are not connected to the internet. It also requires internet for many of its automatic trigger functions and features and you might encounter some glitches and performance issues at times. But all this is understandable, since the device is cloud based.
