

thermostats making the system even more efficient. There are also smart standalone air conditioning units.

The best way to set up a smart HVAC system is to use a traditional HVAC along with a smart thermostat. If you are willing to invest more, you can pair it with smart vents. Or instead just install a smart air conditioning unit in each room.

Nest Learning Thermostat V.3

Google bought this smart house devices manufacturer in 2014. Nest has a wide range of diverse smart home products and the Nest Learning Thermostat is one of them. The latest version of the device has pioneered HVAC

automation and tops most of 'best smart thermostats' lists online.

The device has many features that give it an edge over most of its competition. It has sleek and modern looks that will blend into any environment and comes with a circular touch screen display. It comes with an intuitive mobile application that lets you control the device from anywhere, be it your couch or the other side of the world. The app also shows you several useful statistics including the status of your devices, energy consumption

and power you saved. It's relatively easy to use and can be installed without calling a professional to your house, though you might need to go through some how-to videos online.

It is compatible with a wide number of other smart devices and hubs, including the Amazon echo and Google Home. It also comes with built in support for IFTTT (If This Then That) making it very convenient to integrate into and automate your smart home.

The device is smart enough to learn from your habits and actions, and over time, will change the temperature of your bedroom as soon as you wake up, maintain the climate in the house as per your preference and the weather outside. It will even automatically shut down and save power when no one is at home. Priced at around \$250 (roughly ₹17,000) on Amazon.com, the Nest Learning Thermostat is one of the best smart thermostats out there right now.
