

Can communicate over wires and wirelessly: double wham!

hold wireless products (2.4 GHz), this is a much lower band. This gives it the advantage of being unaffected by interference.

One major advantage of Z-Wave is the interoperability that it provides. All Z-Wave devices can communicate with every other Z-Wave device, notwithstanding the type, version or brand. Also, the interoperability is both backwards and forward compatible in the Z-Wave ecosystem. What this means is that a Z-Wave device that hits the market today would work well with Z-Wave products from a decade back. And yes, it will also work

Can communicate over wires and wirelessly: double wham!

well with the devices of the future – though some limitation in functionalities may be inevitable in such scenarios.

Presently, there are more than 1,200 distinct Z-Wave compatible devices in the market. Z-Wave devices have very low power consumption,

and they are meant for ease of setup and use. As is the case with Insteon, the mesh network of a Z-wave also makes all the devices in it double as repeaters.

ZigBee

You can say that ZigBee is a close cousin of Z-Wave. For instance, like with Z-Wave, ZigBee too is an exclusively wireless protocol. But the acceptance
