

# Home Sweet Automation!

**N**o matter which way you look at it, technology has been headed towards automation for a long time now. In fact, isn't the very basic principle of technology to make our lives easier by leaving fewer things to be explicitly done by us? It might be making us all lazier everyday, or one might argue that it is giving us far greater time to pursue whatever we desire. Whatever might be the effect, there is no doubt that automation is the future and the place that it is happening the most significantly is right in our homes.

It was not too long ago that we visualised houses of the future where things would be done on their own - lights coming on by themselves, coffee being brewed just the way you like as you're about to wake up and your shower knowing the weather outside and adjusting the water temperature accordingly. And now we are at a point where technology to achieve all that has been around for a while and has now become affordable. Hence, it is not a particularly big surprise that we are witnessing some amazing things happening in the world of home automation.

During the short duration in which home automation has come out of its nascency, it has mostly been brought from paper to real life by startups which, although industrious and innovative, have lacked the outreach that a big manufacturer can offer. Not any more though, with Amazon's Alexa and Google Home making their presence known. If there was ever a time when you needed to know all that you could about home automation, it is now. For when a new technology is on the verge of becoming mainstream, the ways its misuse could harm you, are way more significant than the way its proper usage could benefit you.
