

But home automation doesn't just give us a live view of the Internet of Things at work, it also helps make the house smarter, and your life much easier. But to bring this about, you also need something that's been helping make our lives better for a while now- software.

The key function of the software in home automation

The major function of home automation being automating the myriad devices in the house, it might be tempting to think that the key function of the software that drives it would be the same. But such an assumption might be simplistic.

The old adage of the software being the soul of the machine holds true in the case of home automation as well. But in this case the soul's purpose

"You do what you're meant to do," applicable for a software as well

is not just to animate the hardware but also to dictate how the hardware functions. For instance, using the software you can decide/program which parameters would trigger the heat sensor etc. and such programming could be distinct from one user to another, owing to the different functions that people seek from home automation.

This dynamism with which you can program the devices makes the primary function of the software a moot point. In most cases, it's the customization which gives the software its strength. After all, though two houses may be designed the same, no two homes are truly the same.

Key demands from a home automation software

Flexibility:

Flexibility in this context means that one should be able to program to get the
